

The App called ADAM

Android and admin panel

There will be 2 modules

1. User module
2. Admin module

User module features

- Login
- sign up
- manage Profile
- enter source and destination location
- view current weather of the destination location (this open api can be paid to get extra features
- Like future forecast)
- view Products of different categories like (shirts, pants, caps , shoes , glasse) according to the current weather of the destination location
- Can add the shown products to Cart
- and specify the delivery location for products
- Select payment methods either cash on delivery or stripe
- Weather will be told via Voice
- and products will be shown according to the current weather of the destination as suggestions but below that general products will also be shown
- Dark mode and light mode the user can turn on and off
- Language changes krsakhy means k agar American use kr raha hai app to English main ho app if arab using to arbi main ho

Basically the app which suggest users about its daily routine

For example:

Let's start like this

What if we could make all leading companies like Nike Lacoste Zara Gucci any company in one app for advertisement and directions to make your life easier

For example

I want to fly to Europe and I don't know what kind of weather is there or what to take in my bag I will take some photos of my clothes glasses shoes anything...

The app talks and writes what should I take and what kind of weather it will be there, the talking should be in English for a start and slang way like street talk to make it cooler and more efficient. if I don't have any matching clothes or shoes or bags or what ever in your mind the app will offer me a many shop to go to ...

Now the point of making money from these app is the leading companies like Zara like Lacoste or any company, will take place in this app for advertisement purposes

That I will take a slice percent on each ad that will pop up or from buying the item

This is just a start....

Another example that has in the app to put reminders in it or clock alarm like this

She will wakes me up to tell me that I have work on 8:00 o'clock

And she will suggest the temperature outside, for example she will talks to me to tell me to wear the blue jeans and the white shirt and tell me that it's a little bit cold you should take the jacket with you and if I don't have any fitting jacket she will offer me what brand or shop should I buy or wear it will open google maps or waze any gps app and will tell me where to go what store to go

Another example

I have wedding to my friend or sister or anyone I will write it or talk to the app to save the date for me she will remind me what day what hour and she will direct me to best shops to buy outfit if I don't have anything matching to wear I mean she will be like a reminder or adviser and advertisement app to all leading companies

Every company can take place in the app for anything in the world even food best places to food she will direct me if I'm not home or out of the country another thing she can take place in hospitals to remind every each one what time to take

the pill or advertise some similar pills because there is a lot of companies that have replaceable pill like the original but the name is different I know from my country I'm from Israel

She is adviser reminder and virtual human being to talk to she can offer you anything you want its all probably linked to google or gps waze google maps...

Admin module features

- We will create a very simple and plain Admin Panel
- Where Admin can perform following operations:
- Create A Store (all detail info)
- Add Products off Different categories with images and detail info
- can add products in different stores
- view all stores
- Edit/Delete Stores
- Edit/Delete Products
- view all Products of a Store
- View all Users of the App
- View an Ordered Item by User and its detail Info

Admin will have to Add Products with all Info for example

If he is adding a shirt

Then he will selec fields like

If weather is moderate and pleasant...

Like he must specify all the required fields of a products that in which weather this product will be used

And our app will hit an api to server also send the desired weather so that api can filter only desired products and show in the app
